

THE FARMER WANTS A BUTTON

Hour 25 – 27

Hello there.

First, thank you. You've survived a database attack, bad sensor data, an alien communications blackout, a water shortage, and a sensor going dark without warning. I've been watching. I have no idea how you did it. I'm a farmer.

I grow things.

I have one small request.

"I want a button. A real button — the kind I can press with my thumb when I'm standing in the field with muddy gloves on. Press it, something useful happens. That's all I ask."

You have extra buttons at your station. Build me a feature. Something a farmer, someone who has never opened a terminal and never plans to, would actually want to use. The judges will press it. Make it worth pressing.

Items provided to your station:

- Extra physical buttons

Some ideas: but don't let these limit you: Emergency stop, Manual irrigation override, One-click irrigation test, Maintenance mode.

⚠ If you implement Emergency Stop — it must override all active automation, not just block new commands while an existing one keeps running.

Your Objectives :

- Assigned feature is fully functional — not a UI button with no backend action
- Implement it quickly and correctly — speed and creativity both count

Your Submission :

- Explain the feature you implemented and why you chose it
- SVN commit -m "Challenge6 : Completed" --username [username]
