

FINAL BOSS

PERFECT STORM

You made it this far. Now everything hits at once.

The judges will simultaneously trigger all failure conditions at your station - *internet down*, one sensor physically removed, water tank running low, and *extreme temperature values* injected into your data. No sequence. No warning. **All at once.**

This is not a new challenge. It is a stress test of everything you have already built. If your solutions from the previous boxes were solid, this should just work.

Conditions triggered by the judge:

- Internet down
- One sensor physically disconnected
- Water tank manually reduced (low level)
- Extreme temperature values introduced

You didn't just build a system. You built one that survives. That's the difference between an engineer and a great one.

Your Objectives :

- Show that your system is still working for all previous challenges — simultaneously
- No manual restart, no patching on the fly

Your Submission :

- `SVN commit -m "Bonus Challenge : Completed" --username [username]`
