

A WARNING FROM FUTURE

Your sensors are lying. Don't let your system believe them.

Hour 12

You have received a warning from the future.

Publish the MQTT trigger below to begin this challenge. Once triggered, the central station will automatically start inserting abnormal values into your sensor table, readings like temperature 888–999 and soil moisture -20% that no real sensor on this farm could ever produce.

MQTT Host : 192.168.98.50

MQTT Port : 1883

MQTT Topic : hackathon/{teamname}/Challenge2

MQTT Message : {type:start_challenge;message:"Please start Challenge 2"}

Your job is to catch them. Detect the impossible values before they reach your automation logic, raise a visible warning on your dashboard, and discard them, all without crashing, and without your system taking any physical action based on bad data.

"Your system believed a lie – and the farm paid for it. Bad data acting on real hardware is not a bug. It's a failure of judgement."

Your Objectives :

- Detect abnormal sensor values automatically
- Raise warnings at dashboard when bad data is received
- Ignore invalid readings

Your Submission :

- Screenshot comparing graph, stable values vs. malicious data insertion
- SVN commit -m "Challenge2 : Completed" --username [username]
