

The network is dropping. The farm can't stop.

Hour 16

Once you publish the MQTT trigger below, a script will block your team's WiFi connection. You are now offline.

MQTT Host : 192.168.98.50

MQTT Port : 1883

MQTT Topic : hackathon/{teamname}/Challenge3

MQTT Message : {type:start_challenge;message:"Please start Challenge 3"}

Your system must continue operating on its own — locally, on the edge. Sensor readings keep going, irrigation logic keeps running, data keeps being logged.

When connectivity returns, every single reading collected during the blackout must be restored to the central station with no gaps and no duplicates.

"The farm doesn't know the internet is down. The crops still need water. Your system must work exactly the same whether it's online or not."

Your Objectives :

- Core irrigation logic keeps running without internet : fully edge, not cloud-dependent
- Local logging works : all data stored on local storage during the offline period
- Data buffering : no data loss or duplication when syncing back after reconnect
- Offline dashboard is accessible and usable locally
- Bonus — automatic sync when connectivity returns, no manual trigger needed

Your Submission :

- SVN commit -m "Challenge3 : Completed" --username [username]
