

WATER CRISIS

The water is running out. Not everyone gets an equal share.

Hour 20

You will receive 4 water containers and 2 pumps. Water flows from Container 1 → Container 2 via Pump 1, and from Container 3 → Container 4 via Pump 2. Only Containers 1 and 3 are filled. At some point, Container 1 will be manually reduced to 25% capacity.

Your system must detect the low water level and respond — not by treating all zones equally, but by prioritising irrigation zones based on what matters most. When the judge asks you to explain your allocation logic, you must have a clear and reasoned answer.

Items provided to your station:

- 2 water pumps and relays
- 4 water containers — each marked at the same level
- Only Containers 1 and 3 are filled with water

"Smart resource allocation means some zones get more, some get less - and there is a real reason behind every decision. 'We divided equally' is not an answer."

Your Objectives :

- Prioritise irrigation zones : maintain crop health with limited water resources
- Maintain crop health with limited resources

Your Submission :

- Explain water allocation logic
- SVN commit -m "Challenge4 : Completed" --username [username]
